# GLP-1 agonists. Is obesity a therapeutic target in HF?

Beatriz Díaz Molina | *Hospital Universitario Central de Asturias*

# Obesity and overweight

Obesity is a **chronic** complex disease defined by excessive **fat deposits** that can impair health.

(body fat > 25 % ♂ and > 33 % ♀ ).

- ✓ The **body mass index is a surrogate marker of fatness**. For adults, WHO defines overweight and obesity as follows:
  - ✓ overweight is a BMI greater than or equal to 25; and
  - ✓ obesity is a **BMI** greater than or equal to **30**.
- ✓ Additional measurements, such as the **waist circumference**, (> 102 cm ♂ y > 88 cm ♀ ) can help the diagnosis of obesity.

The worldwide prevalence of obesity more than **doubled between 1990 and 2022**. About **16%** of adults aged 18 years and older worldwide were obese in 2022.

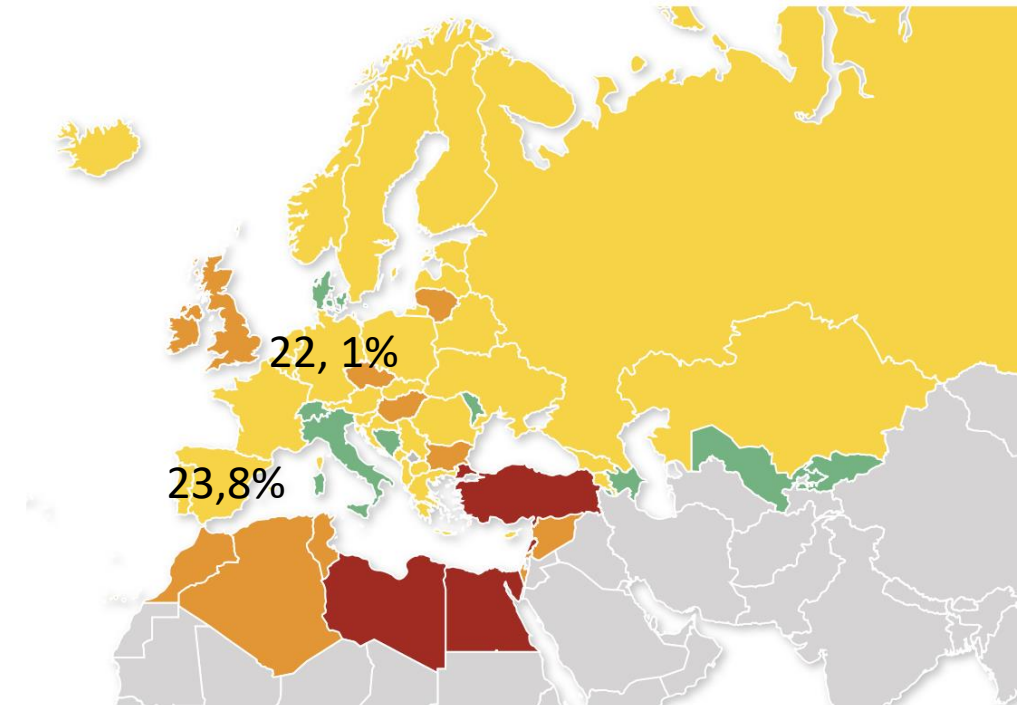

## European Society of Cardiology: the 2023 Atlas of Cardiovascular Disease Statistics

In 2019, 54.8% (IQR 49.6%–56.7%) of people in ESC member countries were overweight and **17.0%** (IQR 15%–20%) obese.

Prevalence of obesity (BMI  $\geq 30$  kg/m<sup>2</sup>) across ESC member countries in 2019. Adapted from Timmis *et al.*

it is estimated that **over half** the world population will be overweight by 2035 and nearly a **quarter** will be obese.

European Heart Journal (2024) 00, 1–44

Estimated prevalence of obesity in adult population

European Heart Journal (2024) 00, 1–36

# The estimated prevalence of important phenotypes of primary heart failure with preserved ejection fraction (HFpEF)

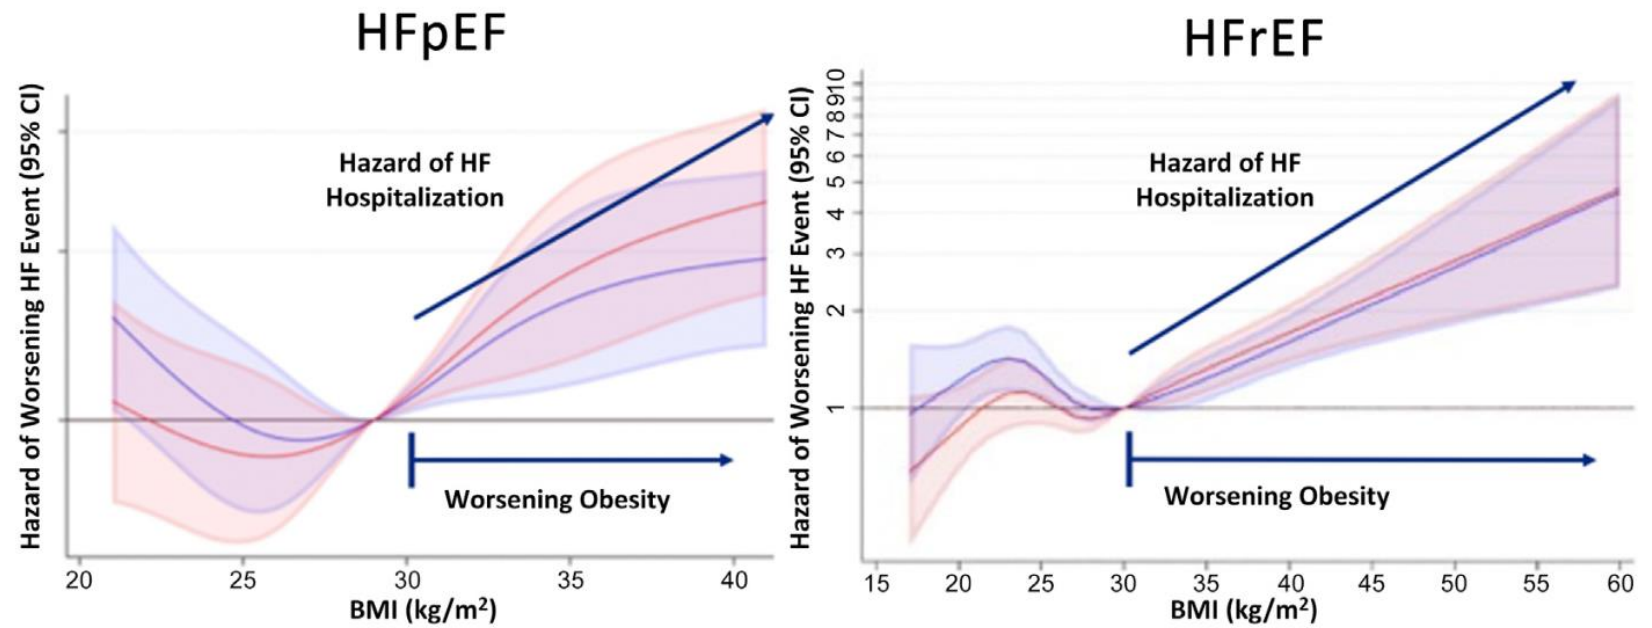

Eur J of Heart Fail (2023) 25, 936–955

# Association between body mass index and risk of heart failure with reduced ejection fraction (HFrEF) and heart failure with preserved ejection fraction (HFpEF).

JACC Heart Fail. 2018;6:975–982.

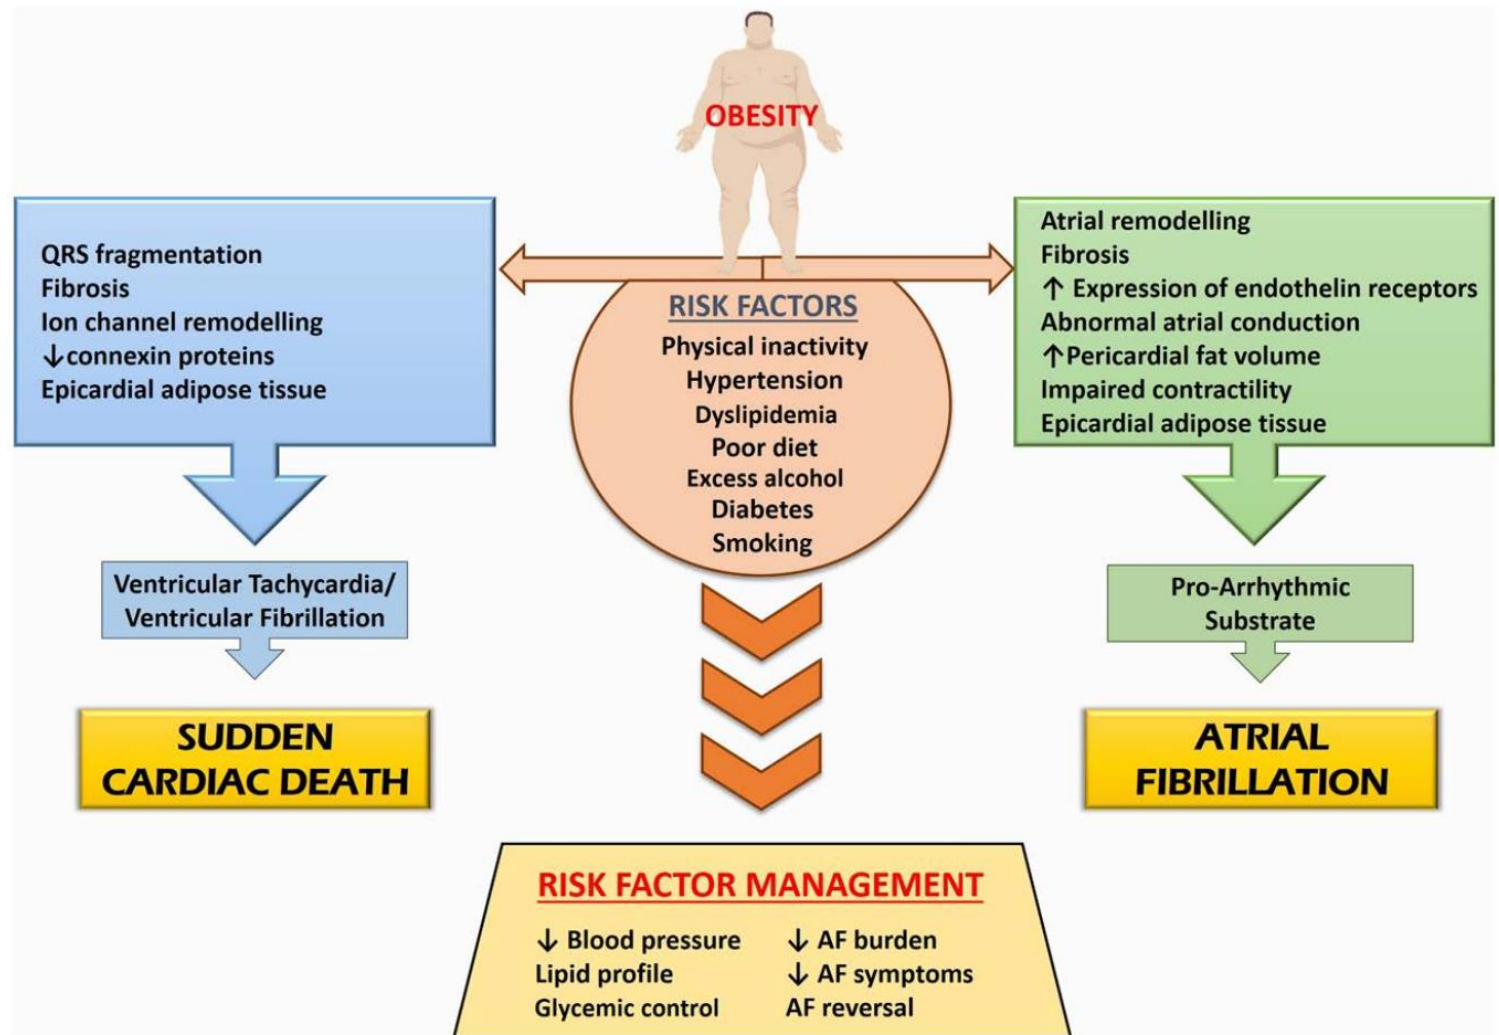

J Am Coll Cardiol HF 2024;12:28–34

## Relationships between obesity and cardiac arrhythmias.

Obesity is associated with **cardiovascular risk factors** such as hypertension, diabetes and dyslipidemia, which have a **deleterious impact** on heart function.

And also to **pathologies that favor the appearance of HF** such as Chronic Kidney Disease and Obstructive Sleep Apnea.

Circulation. 2021;143:e984–e1010.

**Ectopic fat** is defined as storage of TG in tissues other than adipose tissue, that normally contain only small amounts of fat, such as the liver, skeletal muscle, heart, and pancreas.

Int J Endocrinol 2012; 983814

Obesity and epicardial adiposity are associated with haemodynamic signs of **pericardial constraint** in patients with HFpEF.

ESC HF 2024;11: 1698-1706

Visceral adipose tissue as a **source of inflammation** and promoter of atherosclerosis.

Atherosclerosis 2014; 233: 104-112

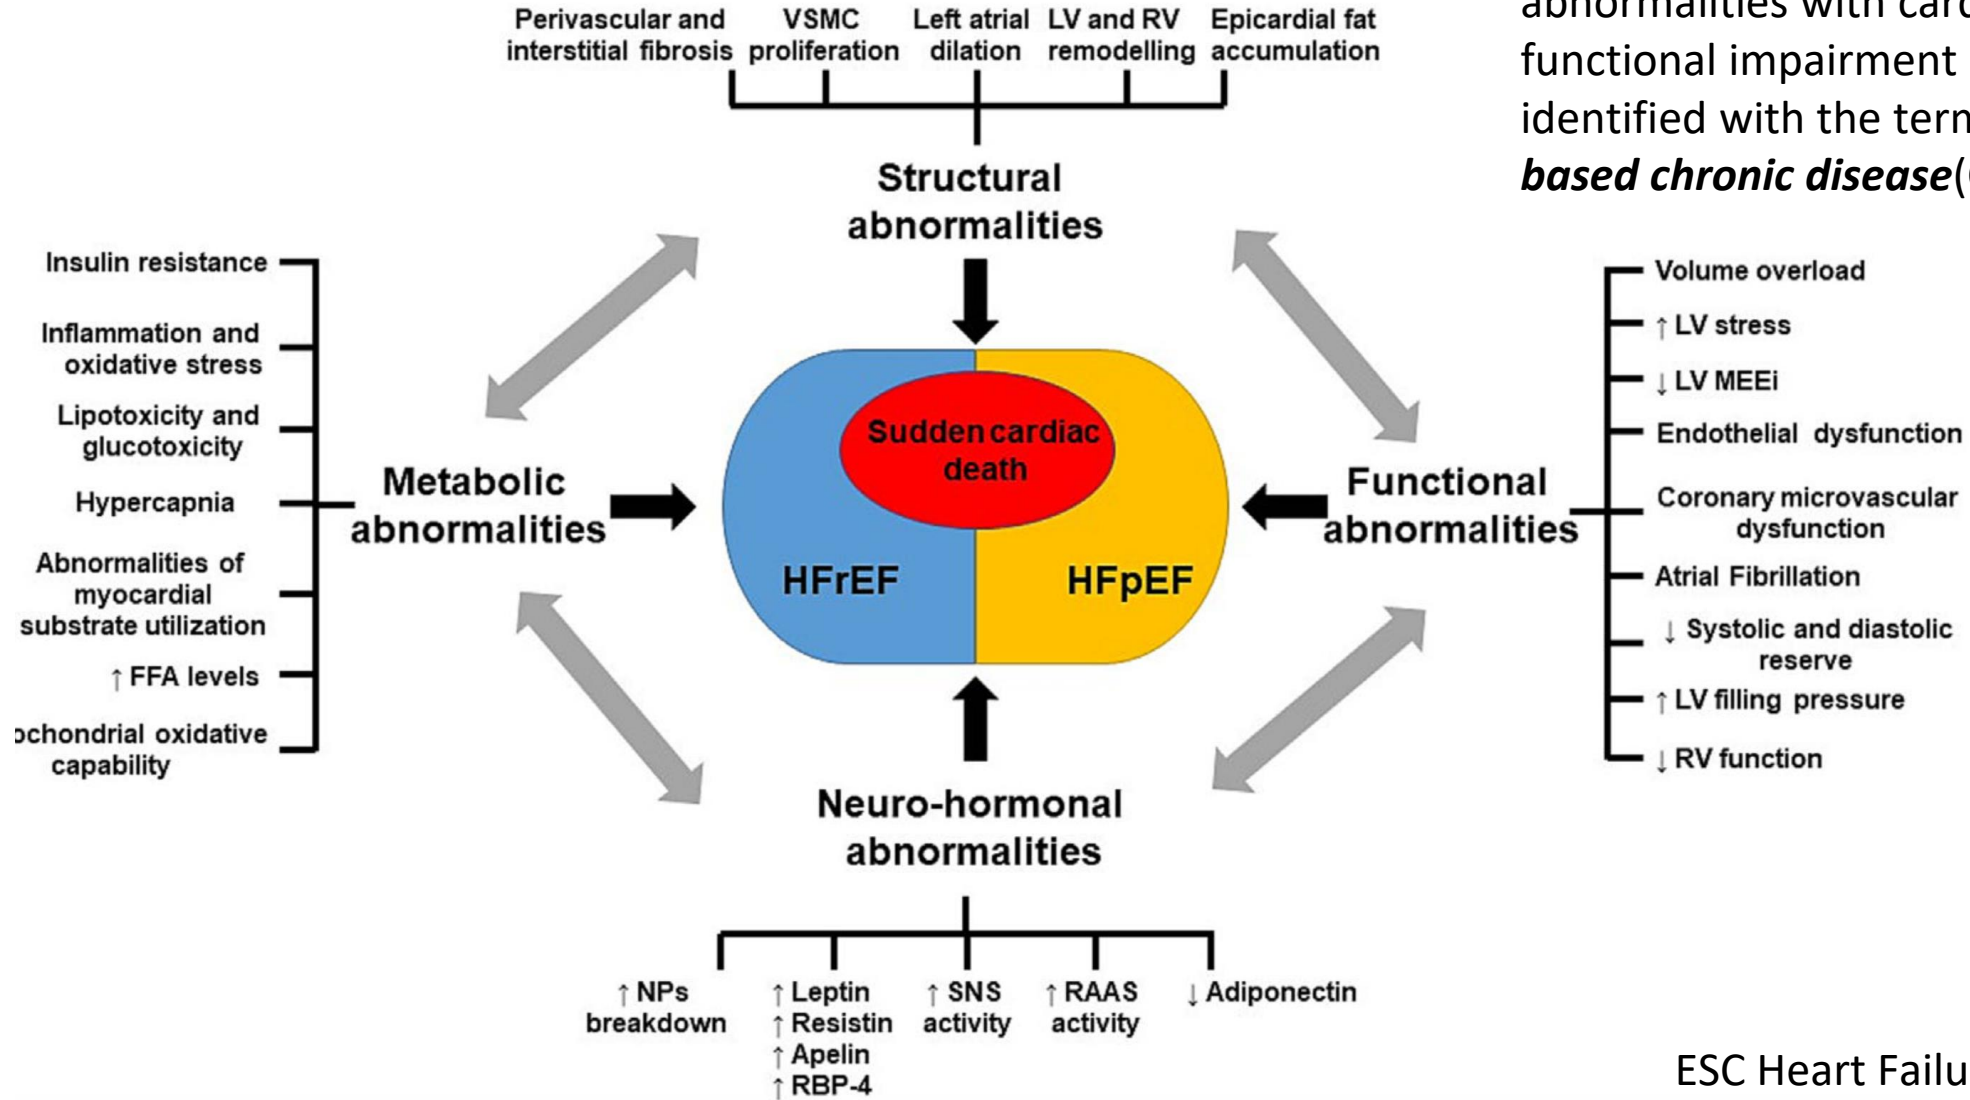

**Epicardial cells express CA125**, which is positively associated with **inflammatory and fibroblast markers** in epicardial adipose tissue.

J Transl Med 2024 Jul 3;22(1):619.

Circulation. 2021;143:e984–e1010.

# Obesity: the perfect storm for heart failure

The combination of metabolic abnormalities with cardiac structural and functional impairment is currently identified with the term **cardiometabolic-based chronic disease (CMBCD)**.

ESC Heart Failure 2024

# Is obesity a therapeutic target in HF?

A pair of hands holds a white rectangular sign with rounded corners. The sign features the word "YES!" in a large, bold, black, sans-serif font. The hands are positioned on the left and right sides of the sign, with fingers gripping the edges. The background is a clear blue sky with soft, white clouds. The lighting is bright, suggesting an outdoor setting during the day.

J Am Coll Cardiol 2024

# Semaglutide and diuretic use in obesity-related heart failure with preserved ejection fraction: a pooled analysis of the STEP-HFpEF and STEP-HFpEF-DM trials

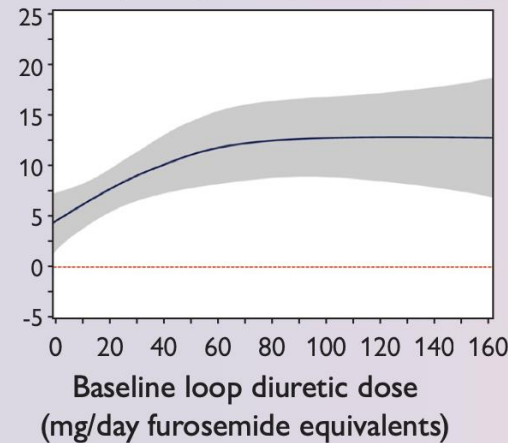

Semaglutide was effective and safe regardless of baseline diuretic use, but KCCQ-CSS improvements were magnified at ↑ loop diuretic doses

Totally daily dose of loop diuretics increased in the placebo arm and decreased in the semaglutide arm during follow-up

Semaglutide reduced new initiation of loop diuretics by 71% and resulted in a 2.7-fold ↑ likelihood of loop diuretic discontinuations (P=0.02)

## Primary outcome: KCCQ-CSS

52-week treatment difference (semaglutide-placebo)

P-interaction = 0.011

## Loop diuretic dose changes

Loop diuretic dose changes (mg/day furosemide equivalents)

Estimated treatment difference over 52 weeks: -11.8 mg/day (95% CI -16.8; -6.8); P<0.0001

## New loop diuretic initiation

Cumulative incidence of new loop diuretic initiations

HR 0.29 (95% CI 0.16, 0.52); P<0.0001

European Heart Journal (2024) 00, 1–16

# STEPping down diuretic therapy with semaglutide in obesity-related heart failure with preserved ejection fraction: decongestion or disease modification?

Effects of selected pharmacotherapies on loop diuretic use in recent HFmrEF/HFpEF trials

STEP-HFpEF Program	DELIVER	EMPEROR-Preserved	PARAGON-HF	TOPCAT-Americas
Median BMI	30 kg/m <sup>2</sup>	30 kg/m <sup>2</sup>	30 kg/m <sup>2</sup>	34 kg/m <sup>2</sup>
Baseline loop diuretic use	77%	80%	78%	77%

- ❑ Enhance afferent renal arteriolar vaso ↑, renal Flow and natriuresis.
- ❑ Attenuate reflex renal vaso ↓ renal in response to loop diuretic.
- ❑ ↓ kidney inflammation.
- ❑ Preserve kidney structure and function (FLOW).
- ❑ ↓ adiposity, pericardial restraint and adverse ventricular interaction.

European Heart Journal (2024) 00, 1–4

# Effect of Semaglutide on Cardiac Structure and Function in Patients With Obesity-Related Heart Failure

## Treatment Effects of Semaglutide on LA Volume and Other Parameters

Mean difference (95% CI)  
-6.13 (-9.85 to -2.41) mL  
 $P = 0.0013$

Benefits of semaglutide on LA remodeling were consistent irrespective of age, sex, BMI, NT-proBNP, hsCRP, diabetes status, AF status, LVEF, and background pharmacotherapy

Semaglutide also improved E wave velocity, E/A ratio, E/e' average, and RV remodeling compared with placebo, but did not impact LV mass, LV mechanics, or LA strain

## Benefits of Semaglutide on LA Volume Related to Magnitude of Weight Loss

However, benefits of semaglutide on E wave velocity, E/e' average, and RV end-diastolic area were not associated with weight change between baseline and 52 weeks

Richard Pratley, M.D., for the FLOW Trial Committees and Investigators\*

N Engl J Med 2024;391:109-21.

# Rationale, design and baseline data of FLOW, a kidney outcomes trial with once-weekly semaglutide in DM2 and CKD

**flow**

## Methods

### Participants:

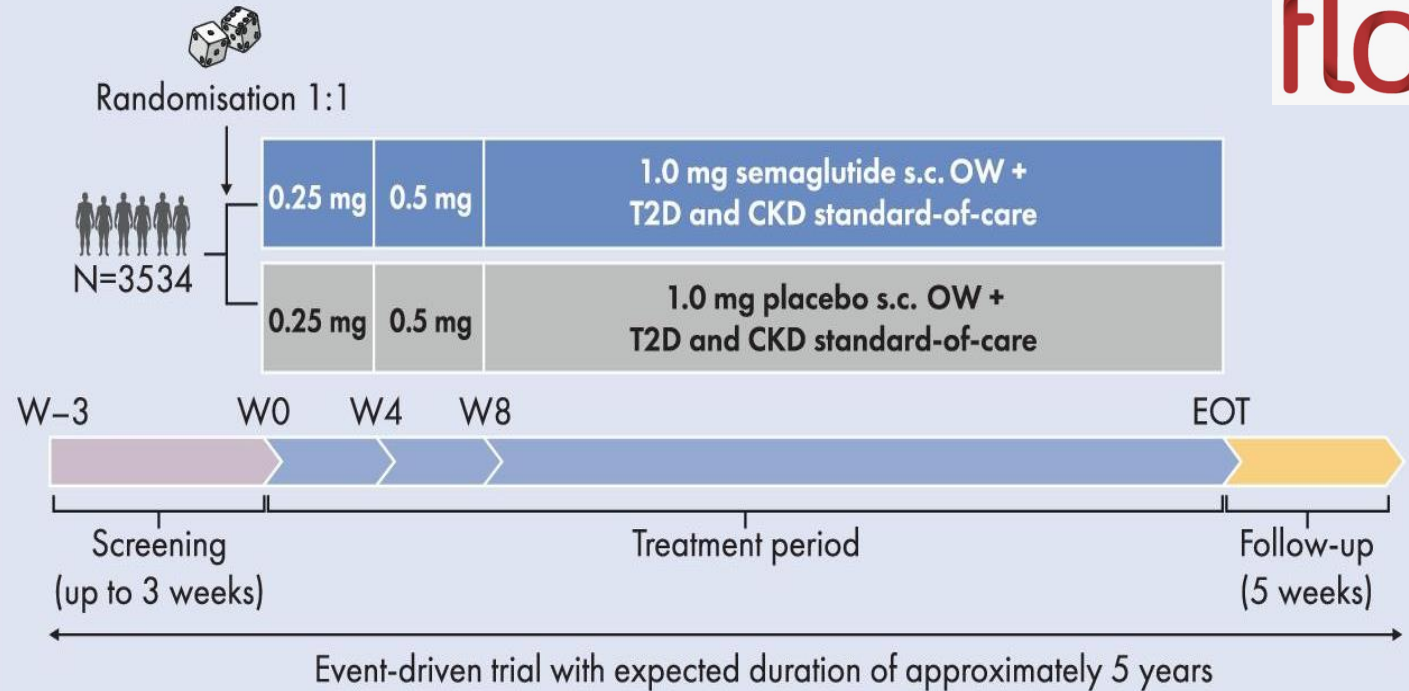

- Adults with T2D
- eGFR  $\geq 50$  to  $\leq 75$  ml/min/1.73 m<sup>2</sup> and UACR  $>300$  to  $<5000$  mg/g OR
- eGFR  $\geq 25$  to  $<50$  ml/min/1.73 m<sup>2</sup> and UACR  $>100$  to  $<5000$  mg/g

### Composite primary endpoint:

Time to first occurrence of:

- Kidney failure (persistent eGFR  $<15$  ml/min/1.73 m<sup>2</sup> or initiation of CKRT);
- Persistent  $\geq 50\%$  reduction in eGFR; or
- Death from kidney or CV causes

## Baseline characteristics

68.2% at very high risk for CKD progression according to KDIGO categorisation, eGFR of 47.0 (15) ml/min/1.73 m<sup>2</sup>; median UACR of 568 (range: 2–11 852) mg/g

### Advanced type 2 diabetes:

Mean age 66.6 years  
Mean diabetes duration 17.4 years  
Mean HbA<sub>1c</sub> 7.8%

15.5% receiving SGLT-2is

**Cardiovascular death**

## IN SUMMARY

- ✓ **Association** between obesity and **risk of heart failure** with reduced ejection fraction (HFrEF) and heart failure with **preserved ejection fraction** (HFpEF).
- ✓ In patients with **obesity-related HFpEF**, semaglutide **improved heart failure-related symptoms and physical limitations**. Semaglutide also led to a **reduction in loop diuretic** use.
- ✓ Semaglutide appeared to **improve adverse cardiac remodeling** compared with placebo, further suggesting that treatment with semaglutide may be disease modifying among patients with obesity-related HFpEF.
- ✓ In patients **with HFpEF**, semaglutide reduced the risk of the combined endpoint of **cardiovascular death or worsening heart failure** events, and **worsening heart failure events** alone.
- ✓ **AND If Preexisting CV disease**, semaglutide reduces **cardiovascular death/CV any cause**.
- ✓ These data support the use of semaglutide as an efficacious therapy to **reduce the risk of clinical heart failure events in patients with HFpEF**, for whom few treatment options are currently available.
